AMENDMENT TO THE CLAIMS

 (Previously Presented) A method for implanting a prosthetic device in a body comprising:

placing a first suture through tissue at a first position using a first needle of a suture system having at least three needles connected by suture strands;

placing a second needle of the suture system, the second needle being attached to a double stranded suture, in the tissue at a distance from the first position, different strands of the double stranded suture that are attached to the second needle having different indicators such that the different strands attached to the second needle can be identified;

placing additional sutures using additional needles attached to the second needle through the tissue;

placing the first suture in the prosthetic device using the single-threaded needle of the suture system;

placing the second needle and an associated doublestranded suture in the prosthetic device;

placing additional sutures using additional doublestranded sutures along the prosthetic device; and

securing the prosthetic device into position.

(Currently Amended) The method ifof claim 1 wherein the 2.

strands of the double-stranded suture are of different

colors.

3. (Original) The method of claim 1 wherein the first suture

strand is green and another suture strand is white.

(Original) The method of claim 2 wherein a third strand 4.

color is formed with a pair of braided strands of different

colors.

(Currently Amended) suturing 5. Α suture device for

prosthetic device to tissue comprising:

a plurality of at least three connected needles with at

least one of the connected needles being attached to a double

stranded suture, at least one strand of the double stranded

suture attached to the at least one needle having a visual

indicator to distinguish the at least one strand from a

second strand attached to the at least one needle the

plurality of at least three connected needles including a

first end needle attached to a single suture strand and a

second end needled attached to single suture strand;

each suture strand extending between a pair of the

connected needles such that suture strands can be identified

with the visual indicator, the needles being removable from

the suture strands after insertion through a prosthetic

device and the ends of each strand being identified and

secured together to attach the device to the tissue.

6. (Original) The suture device of claim 5 wherein the suture

strands include strands of at least two different colors.

7. (Original) The suture device of claim 5 wherein the device

has at least three needles that are each associated with at

least two strands.

8. (Original) The suture device of claim 5 further comprising a

first needle attached to a single strand and a last needle

attached to a single strand and said at least one needle

associated with at least two suture strands there between.

(Previously Presented) The suture device of claim 5 further 9.

comprising a plurality of suture pads such that each needle

is attached to another needle with a suture strand having a

pad attached to the suture strand.

(Previously Presented) The suture device of claim 5 wherein 10.

the prosthetic device further comprises a cuff through which

suture strands are threaded.

11. (Previously Presented) The suture device of claim 5 wherein

the prosthetic device comprises a valve.

(Previously Presented) The suture device of claim 5 further 12.

comprising a package for housing the suture device, the

package having at least six needles.

13. (Previously Presented) The suture device of claim 5 further

comprising a mechanical suture placement device.

(Previously Presented) The suture device of claim 5 wherein 14.

the prosthetic device comprises an aortic valve.

15. (Previously Presented) The method of claim 1 further

comprising providing one or more suture pads that are

attached to the suture strands.

(Previously Presented) The method of claim 1 further 16.

comprising passing the suture strands through a cuff of the

prosthetic device.

(Currently Amended) The method of claim 1 further comprising 17.

passing the different strands attached to the second needle

through the same hole in the tissue at a second position, the

second needle having a diameter larger then the strands that

are attached to the second needle.

(Previously Presented) The method of claim 1 wherein the 18.

prosthetic device comprises a valve.

19. (Previously Presented) The method of claim 1 further

comprising providing the suture system in a package.

20. (Previously Presented) The method of claim 1 further

comprising providing a suture system having at least needles

attached by suture strands with alternating colors.

21. (New) A method for implanting a prosthetic device in a body

comprising:

placing a first suture through tissue at a first

position using a first needle of a suture system having at

least three needles connected by suture strands;

placing a second needle of the suture system, the second

needle being attached to a double stranded suture, in the

tissue at a distance from the first position, different

strands of the double stranded suture that are attached to

the second needle having different indicators such that the

different strands attached to the second needle can be

identified the second needle having a diameter larger then

the strands that are attached to second needle; and

placing a third needle of the suture system to attaché

the prosthetic device to the tissue.

22. (New) The method of claim 21 wherein the strands of the

double-stranded suture are of different colors.

-7-

23. (New) The method of claim 21 wherein the suture system has

at least two double stranded needles.

24. (New) The method of claim 21 wherein the system has at least

six needles connected by suture strands.
